

# What is retrieval augmented generation?

- ▶ Allow LLMs to utilize a knowledge database where it has not seen previously to generate answers
- ▶ Ref: <https://cloud.google.com/use-cases/retrieval-augmented-generation>
- ▶ Vector DB:
  - ▶ a database that stores contents in a n-dimensional vector space, where the distance between different instances in the vector space measures the similarity between them.
- ▶ LangChain: <https://blog.langchain.dev/tutorial-chatgpt-over-your-data/>

# How to get arXiv data?

- use import arXiv (search individual files)
- arXiv API description
