

Outline of NLP pipeline without RAG

- ❖ Data preprocessing
 - ❖ Gathering textual data
 - ❖ Tokenization (converting words to tokens 1,2,3...)
 - ❖ Create word embedding (converting tokens to vector embeddings) `nn.Embedding()` BERT
- ❖ NLP task
 - ❖ Positional encoding layer
 - ❖ Transformer NN (encoder-decoder, decoder only, encoder only)
 - ❖ How to train a transformer?
 - ❖ Machine translation (“Good morning” to “Guten Morgen”)
 - ❖ Chatbot question and answer: sentence pairs (“tell a joke” to “once a time...”)
 - ❖ Fill in blank (representation learning “hello and how _ you do?” e.g., BERT)
 - ❖ How to do inference?
 - ❖ Only provide the input to encoder. for decoder only input [`< sos >`] and produce rest of tokens one at a time.

RAG + NLP

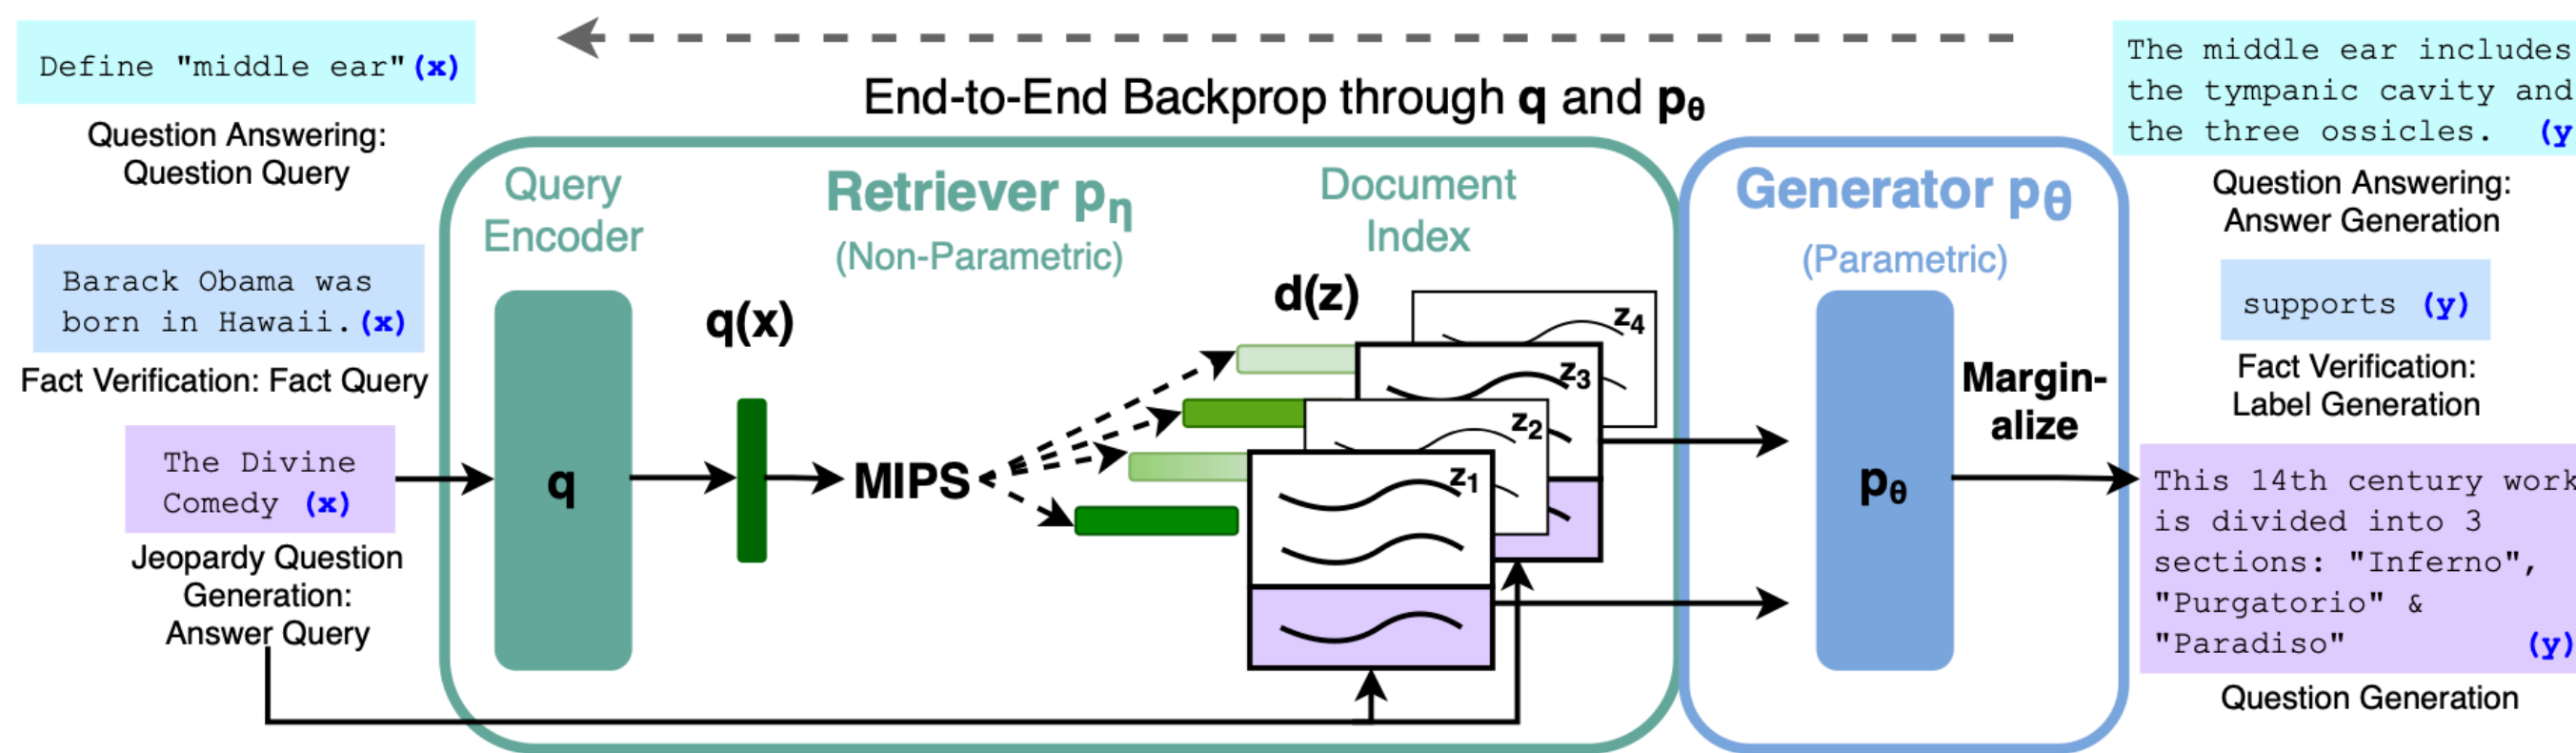

Figure 1: Overview of our approach. We combine a pre-trained retriever (*Query Encoder* + *Document Index*) with a pre-trained seq2seq model (*Generator*) and fine-tune end-to-end. For query x , we use Maximum Inner Product Search (MIPS) to find the top-K documents z_i . For final prediction y , we treat z as a latent variable and marginalize over seq2seq predictions given different documents.

- ❖ Let's use arXiv metadata (only) as an example
- ❖ Get the metadata
- ❖ Build a query encoder which encodes the input query.
 - ❖ query encoder is pretrained, e.g., BERT or DPR
- ❖ **Build a vector embedding for each document (ongoing work)**, make it a database indexed by document id
 - ❖ using libraries such as faiss, Elasticsearch, ...
- ❖ The document and input query are concatenated and fed into the generator, which is a conventional transformer as discussed in previous page.
- ❖ **In principle we could create the entire pipeline without relying on chatGPT or Claude!**
